

# Python From Scratch

## Python RegEx & PIP

### **Lesson 17 Content**

- **Python RegEx**

- RegEx Module
- RegEx in Python
- RegEx Functions
- Metacharacters
- Special Sequences
- Sets
- The findall() Function
- The search() Function
- The split() Function
- The sub() Function
- Match Object

- **Python PIP**

- What is PIP?
- What is a Package?
- Check if PIP is Installed
- Install PIP
- Download a Package
- Using a Package
- Find Packages
- Remove a Package
- List Packages

## Python RegEx

A RegEx, or Regular Expression, is a sequence of characters that forms a search pattern. RegEx can be used to check if a string contains the specified search pattern.

### RegEx Module

Python has a built-in package called **re**, which can be used to work with Regular Expressions.

**Import the re module:**

```
import re
```

### RegEx in Python

When you have imported the **re** module, you can start using regular expressions:

**Example**

Search the string to see if it starts with "The" and ends with "Spain":

```
import re
txt = "The rain in Spain"
x = re.search("^The.*Spain$", txt)
```

### RegEx Functions

The **re** module offers a set of functions that allows us to search a string for a match:

Function	Description
<a href="#">findall</a>	Returns a list containing all matches
<a href="#">search</a>	Returns a <a href="#">Match object</a> if there is a match anywhere in the string
<a href="#">split</a>	Returns a list where the string has been split at each match
<a href="#">sub</a>	Replaces one or many matches with a string

### Metacharacters

Metacharacters are characters with a special meaning:

Character	Description	Example
[ ]	A set of characters	"[a-m]"
\	Signals a special sequence (can also be used to escape special characters)	"\d"
.	Any character (except newline character)	"he..o"
^	Starts with	"^hello"
\$	Ends with	"planet\$"
*	Zero or more occurrences	"he.*o"
+	One or more occurrences	"he.+o"
?	Zero or one occurrences	"he.?o"
{ }	Exactly the specified number of occurrences	"he.{2}o"
	Either or	"falls stays"
()	Capture and group	

## Special Sequences

A special sequence is a `\` followed by one of the characters in the list below, and has a special meaning:

Character	Description	Example
<code>\A</code>	Returns a match if the specified characters are at the beginning of the string	" <code>\AThe</code> "
<code>\b</code>	Returns a match where the specified characters are at the beginning or at the end of a word (the "r" in the beginning is making sure that the string is being treated as a "raw string")	r" <code>\bain</code> " r" <code>ain\b</code> "
<code>\B</code>	Returns a match where the specified characters are present, but NOT at the beginning (or at the end) of a word (the "r" in the beginning is making sure that the string is being treated as a "raw string")	r" <code>\Bain</code> " r" <code>ainB</code> "
<code>\d</code>	Returns a match where the string contains digits (numbers from 0-9)	" <code>\d</code> "
<code>\D</code>	Returns a match where the string DOES NOT contain digits	" <code>\D</code> "
<code>\s</code>	Returns a match where the string contains a white space character	" <code>\s</code> "
<code>\S</code>	Returns a match where the string DOES NOT contain a white space character	" <code>\S</code> "
<code>\w</code>	Returns a match where the string contains any word characters (characters from a to Z, digits from 0-9, and the underscore character)	" <code>\w</code> "
<code>\W</code>	Returns a match where the string DOES NOT contain any word characters	" <code>\W</code> "
<code>\Z</code>	Returns a match if the specified characters are at the end of the string	" <code>Spain\Z</code> "

## Sets

A set is a set of characters inside a pair of square brackets `[]` with a special meaning:

Set	Description
<code> arn </code>	Returns a match where one of the specified characters ( <b>a</b> , <b>r</b> , or <b>n</b> ) is present
<code>[a-n]</code>	Returns a match for any lower case character, alphabetically between <b>a</b> and <b>n</b>
<code>[^arn]</code>	Returns a match for any character EXCEPT <b>a</b> , <b>r</b> , and <b>n</b>
<code> 0123 </code>	Returns a match where any of the specified digits ( <b>0</b> , <b>1</b> , <b>2</b> , or <b>3</b> ) are present
<code> 0-9 </code>	Returns a match for any digit between <b>0</b> and <b>9</b>
<code> 0-5  0-9 </code>	Returns a match for any two-digit numbers from <b>00</b> and <b>59</b>
<code>[a-zA-Z]</code>	Returns a match for any character alphabetically between <b>a</b> and <b>z</b> , lower case OR upper case
<code>[+]</code>	In sets, <b>+</b> , <b>*</b> , <b>.</b> , <b> </b> , <b>()</b> , <b>\$</b> , <b>{}</b> has no special meaning, so <code>[+]</code> means: return a match for any <b>+</b> character in the string

## The findall() Function

The `findall()` function returns a list containing all matches.

### Example

Print a list of all matches:

```
import re

txt = "The rain in Spain"
x = re.findall("ai", txt)
print(x)
```

The list contains the matches in the order they are found.

If no matches are found, an empty list is returned:

### Example

Return an empty list if no match was found:

```
import re

txt = "The rain in Spain"
x = re.findall("Portugal", txt)
print(x)
```

---

## The search() Function

The `search()` function searches the string for a match, and returns a [Match object](#) if there is a match.

If there is more than one match, only the first occurrence of the match will be returned:

### Example

Search for the first white-space character in the string:

```
import re

txt = "The rain in Spain"
x = re.search("\s", txt)

print("The first white-space character is located in position:", x.start())
```

If no matches are found, the value `None` is returned:

### Example

Make a search that returns no match:

```
import re

txt = "The rain in Spain"
x = re.search("Portugal", txt)
print(x)
```

---

## The split() Function

The **split()** function returns a list where the string has been split at each match:

### Example

Split at each white-space character:

```
import re

txt = "The rain in Spain"
x = re.split("\s", txt)
print(x)
```

You can control the number of occurrences by specifying the **maxsplit** parameter:

### Example

Split the string only at the first occurrence:

```
import re

txt = "The rain in Spain"
x = re.split("\s", txt, 1)
print(x)
```

---

## The sub() Function

The **sub()** function replaces the matches with the text of your choice:

### Example

Replace every white-space character with the number 9:

```
import re

txt = "The rain in Spain"
x = re.sub("\s", "9", txt)
print(x)
```

You can control the number of replacements by specifying the **count** parameter:

### Example

Replace the first 2 occurrences:

```
import re

txt = "The rain in Spain"
x = re.sub("\s", "9", txt, 2)
print(x)
```

---

## Match Object

A Match Object is an object containing information about the search and the result.

**Note:** If there is no match, the value **None** will be returned, instead of the Match Object.

### Example

Do a search that will return a Match Object:

```
import re

txt = "The rain in Spain"
x = re.search("ai", txt)
print(x) #this will print an object
```

The Match object has properties and methods used to retrieve information about the search, and the result:

**.span()** returns a tuple containing the start-, and end positions of the match.

**.string** returns the string passed into the function

**.group()** returns the part of the string where there was a match

### Example

Print the position (start- and end-position) of the first match occurrence.

The regular expression looks for any words that starts with an upper case "S":

```
import re

txt = "The rain in Spain"
x = re.search(r"\bS\w+", txt)
print(x.span())
```

### Example

Print the string passed into the function:

```
import re

txt = "The rain in Spain"
x = re.search(r"\bS\w+", txt)
print(x.string)
```

### Example

Print the part of the string where there was a match.

The regular expression looks for any words that starts with an upper case "S":

```
import re

txt = "The rain in Spain"
x = re.search(r"\bS\w+", txt)
print(x.group())
```

**Note:** If there is no match, the value **None** will be returned, instead of the Match Object.
